. Recommended: UBP Pro V0.8 64 Bit Download: (UBP Pro V0.8UBP Pro V0.8 ->>>>> 3.84 GiB (4126373551). LuaJIT-2.0.0 beta10 binaries for Windows 2012-09-18 64 bit. How do I find that? Please help! A: Ubuntu, Mint,... and probably other distributions are distributing the packages in a way that they have to maintain them themselves and it's not very easy to find out where a particular package is in the distribution. If you have software that you want to install, you will first need to find the source of the files and use that to compile a version for your system. If you are on Ubuntu for example and you want to find the source for the package luafilesystem you can install a special tool called apt-file which is distributed with Ubuntu. Using apt-file you can find out what packages have a given file. In this case you can see that luafilesystem has the source luafilesystem-1.3.1.tar.gz in it, so you can download that. Once you have the files you can start by simply downloading them. If you want to download the files as a zip archive you can do it with your web browser, but I would suggest using a download manager as for example wget. The next step is to unzip them. If you are on Ubuntu you can unzip with the command: tar -xvzf luafilesystem-1.3.1.tar.gz If you are on another distribution, the command you need will be different. Once you have the files, you need to compile them. To do that you need the source code, so you can download that from the Ubuntu package you found in the previous step. In Ubuntu you can download the source 82157476af
